# 1 Introduction

#### 1.1

Let

$$E(\mathbf{w}) = \frac{1}{2} \sum_{n=1}^{N} (y(x_n, \mathbf{w}) - t_n)^2.$$
 (1.1)

To minimise it, setting the derivative to zero gives

$$\mathbf{0} = \sum_{n=1}^{N} \frac{\partial y(x_n, \mathbf{w})}{\partial \mathbf{w}} \left( y(x_n, \mathbf{w}) - t_n \right). \tag{1.2}$$

Substituting

$$y(x_n, \mathbf{w}) = \sum_{j=0}^{M} w_j x_n^j \tag{1.3}$$

gives

$$0 = \sum_{n=1}^{N} x_n^i \left( \sum_{j=0}^{M} w_j x_n^j - t_n \right).$$
 (1.4)

Therefore,

$$\sum_{i=0}^{M} A_{ij} w_j = T_i \tag{1.5}$$

where

$$A_{ij} = \sum_{n=1}^{N} x_n^{i+j},$$

$$T_i = \sum_{n=1}^{N} x_n^{i} t_n.$$
(1.6)

#### 1.2

Let

$$\tilde{E}(\mathbf{w}) = \frac{1}{2} \sum_{n=1}^{N} (y(x_n, \mathbf{w}) - t_n)^2 + \frac{\lambda}{2} ||\mathbf{w}||^2.$$
 (1.7)

To minimise it, setting the derivative to zero gives

$$\mathbf{0} = \sum_{n=1}^{N} \frac{\partial y(x_n, \mathbf{w})}{\partial \mathbf{w}} (y(x_n, \mathbf{w}) - t_n) + \lambda \mathbf{w}.$$
 (1.8)

Substituting

$$y(x_n, \mathbf{w}) = \sum_{j=0}^{M} w_j x_n^j \tag{1.9}$$

gives

$$0 = \sum_{n=1}^{N} x_n^i \left( \sum_{j=0}^{M} w_j x_n^j - t_n \right) + \lambda w_i.$$
 (1.10)

Therefore,

$$\sum_{j=0}^{M} \tilde{A}_{ij} w_j = T_i \tag{1.11}$$

where

$$\tilde{A}_{ij} = \sum_{n=1}^{N} x_n^{i+j} + \lambda \delta_{ij},$$

$$T_i = \sum_{n=1}^{N} x_n^i t_n.$$
(1.12)

#### 1.3

Let a, o and l be the events where an apple, orange and lime are selected respectively. The probability that an apple is selected is given by

$$p(a) = p(a|r)p(r) + p(a|b)p(b) + p(a|g)p(g).$$
(1.13)

Substituting  $p(a|r) = \frac{3}{10}$ ,  $p(r) = \frac{1}{5}$ ,  $p(a|g) = \frac{1}{2}$ ,  $p(r) = \frac{1}{5}$ ,  $p(a|g) = \frac{3}{10}$  and  $p(g) = \frac{3}{5}$  gives

$$p(a) = \frac{17}{50}. (1.14)$$

If an orange is selected, the probability that it came from the geen box is given by

$$p(g|o) = \frac{p(g,o)}{p(o)}.$$
 (1.15)

Here,

$$p(g, o) = p(o|g)p(g),$$
  

$$p(o) = p(o|r)p(r) + p(o|b)p(b) + p(o|g)p(g).$$
(1.16)

Substituting  $p(o|r) = \frac{2}{5}$ ,  $p(r) = \frac{1}{5}$ ,  $p(o|b) = \frac{1}{2}$ ,  $p(b) = \frac{1}{5}$ ,  $p(o|g) = \frac{3}{10}$  and  $p(g) = \frac{3}{5}$  gives  $p(g, o) = \frac{9}{50}$  and  $p(o) = \frac{9}{25}$ . Therefore,

$$p(g|o) = \frac{1}{2}. (1.17)$$

#### 1.4

Let

$$x = g(y) \tag{1.18}$$

and  $\hat{x}$  and  $\hat{y}$  be the locations of the maximum of  $p_x(x)$  and  $p_y(y)$  respectively. Let us assume that there exists  $\epsilon > 0$  such that  $g'(y) \neq 0$  for  $|y - \hat{y}| < \epsilon$ . Then, differentiating both sides of the transoformation

$$p_y(y) = p_x(g(y)) |g'(y)| (1.19)$$

and substituting  $y = \hat{y}$  gives

$$0 = g'(\hat{y})p'_x(g(\hat{y})) + p_x(g(\hat{y}))g''(\hat{y}).$$
(1.20)

Therefore, in general,

$$\hat{x} \neq g\left(\hat{y}\right). \tag{1.21}$$

Here, let us assume that

$$g(y) = ay + b. (1.22)$$

Then, differentiating both sides of the transformation and substituting  $y = \hat{y}$  gives

$$0 = p_x'\left(g\left(\hat{y}\right)\right). \tag{1.23}$$

$$\hat{x} = g\left(\hat{y}\right). \tag{1.24}$$

By the definition,

$$var f(x) = E(f(x) - Ef(x))^{2}.$$
 (1.25)

The right hand side can be written as

$$E((f(x))^{2} - 2f(x)Ef(x) + (Ef(x))^{2}) = E(f(x))^{2} - (Ef(x))^{2}.$$
 (1.26)

Therefore,

$$\operatorname{var} f(x) = \operatorname{E} (f(x))^2 - (\operatorname{E} f(x))^2.$$
 (1.27)

#### 1.6

By the definition,

$$cov(x,y) = E((x - Ex)(y - Ey)).$$
(1.28)

The right hand side can be written as

$$Exy - E(xEy) - E(yEx) + E(ExEy) = Exy - ExEy.$$
 (1.29)

The right hand side can be written as

$$\int xyp(x,y)dxdy - \int xp(x)dx \int yp(y)dy.$$
 (1.30)

If x and y are independent, by the definition,

$$f(x,y) = f(x)f(y). \tag{1.31}$$

Then,

$$\int xyp(x,y)dxdy = \int p(x)dx \int p(y)dy.$$
 (1.32)

$$cov(x,y) = 0. (1.33)$$

Let

$$I = \int_{-\infty}^{\infty} \exp\left(-\frac{1}{2\sigma^2}x^2\right) dx. \tag{1.34}$$

Then

$$I^{2} = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} \exp\left(-\frac{1}{2\sigma^{2}}\left(x^{2} + y^{2}\right)\right) dx dy. \tag{1.35}$$

By the transformation from Cartesian coordinates (x, y) to polar coordinates  $(r, \theta)$ , the right hand side can be written as

$$\int_0^\infty \int_0^{2\pi} \exp\left(-\frac{1}{2\sigma^2}r^2\right) \begin{vmatrix} \cos\theta & -r\sin\theta \\ \sin\theta & r\cos\theta \end{vmatrix} dr d\theta = 2\pi \int_0^\infty \exp\left(-\frac{1}{2\sigma^2}r^2\right) r dr. \tag{1.36}$$

By the transformation  $s = \frac{r}{\sigma}$ , the right hand side can be written as

$$2\pi\sigma^2 \int_0^\infty \exp\left(-\frac{1}{2}s^2\right) s ds = 2\pi\sigma^2 \left[-\exp\left(-\frac{1}{2}s^2\right)\right]_0^\infty. \tag{1.37}$$

Therefore,

$$I = \left(2\pi\sigma^2\right)^{\frac{1}{2}}.\tag{1.38}$$

By the definition,

$$\mathcal{N}\left(x|\mu,\sigma^2\right) = \left(2\pi\sigma^2\right)^{-\frac{1}{2}} \exp\left(-\frac{1}{2\sigma^2}(x-\mu)^2\right). \tag{1.39}$$

Then

$$\int_{-\infty}^{\infty} \mathcal{N}\left(x|\mu,\sigma^2\right) dx = \left(2\pi\sigma^2\right)^{-\frac{1}{2}} \int_{-\infty}^{\infty} \exp\left(-\frac{1}{2\sigma^2}(x-\mu)^2\right) dx. \tag{1.40}$$

By the transformation  $t = x - \mu$ , the right hand side can be written as

$$(2\pi\sigma^2)^{-\frac{1}{2}} \int_{-\infty}^{\infty} \exp\left(-\frac{1}{2\sigma^2}t^2\right) dt = (2\pi\sigma^2)^{-\frac{1}{2}} I.$$
 (1.41)

$$\int_{-\infty}^{\infty} \mathcal{N}\left(x|\mu,\sigma^2\right) dx = 1. \tag{1.42}$$

Let x be a variable under the Gaussian distribution with mean  $\mu$  and variance  $\sigma^2$ . Then

$$Ex = \int_{-\infty}^{\infty} x \mathcal{N}\left(x|\mu, \sigma^2\right) dx. \tag{1.43}$$

By the definition, the right hand side can be written as

$$\left(2\pi\sigma^2\right)^{-\frac{1}{2}} \int_{-\infty}^{\infty} x \exp\left(-\frac{1}{2\sigma^2}(x-\mu)^2\right) dx. \tag{1.44}$$

By the transformation  $y = x - \mu$ , it can be written as

$$\left(2\pi\sigma^2\right)^{-\frac{1}{2}} \int_{-\infty}^{\infty} (y+\mu) \exp\left(-\frac{1}{2\sigma^2}y^2\right) dy. \tag{1.45}$$

Since

$$(2\pi\sigma^2)^{-\frac{1}{2}} \int_{-\infty}^{\infty} y \exp\left(-\frac{1}{2\sigma^2}y^2\right) dy = 0,$$
 (1.46)

and

$$(2\pi\sigma^2)^{-\frac{1}{2}} \int_{-\infty}^{\infty} \mu \exp\left(-\frac{1}{2\sigma^2}y^2\right) dy = \mu \int_{-\infty}^{\infty} \mathcal{N}\left(y|\mu,\sigma^2\right) dy, \tag{1.47}$$

we have

$$\mathbf{E}x = \mu. \tag{1.48}$$

By the definition,

$$\int_{-\infty}^{\infty} \mathcal{N}\left(x|\mu,\sigma^2\right) dx = 1 \tag{1.49}$$

can be written as

$$(2\pi\sigma^2)^{-\frac{1}{2}} \int_{-\infty}^{\infty} \exp\left(-\frac{1}{2\sigma^2}(x-\mu)^2\right) dx = 1.$$
 (1.50)

Differentiating both sides with respect to  $\sigma^2$  gives

$$(2\pi)^{-\frac{1}{2}} \left(-\frac{1}{2}\right) (\sigma^2)^{-\frac{3}{2}} \int_{-\infty}^{\infty} \exp\left(-\frac{1}{2\sigma^2} (x-\mu)^2\right) dx + (2\pi\sigma^2)^{-\frac{1}{2}} \int_{-\infty}^{\infty} \frac{1}{2} (\sigma^2)^{-2} (x-\mu)^2 \exp\left(-\frac{1}{2\sigma^2} (x-\mu)^2\right) dx = 0.$$
(1.51)

The left hand side can be written as

$$-\frac{1}{2} \left(\sigma^2\right)^{-1} \int_{-\infty}^{\infty} \mathcal{N}\left(x|\mu,\sigma^2\right) dx + \frac{1}{2} \left(\sigma^2\right)^{-2} \int_{-\infty}^{\infty} (x-\mu)^2 \mathcal{N}\left(x|\mu,\sigma^2\right) dx$$
$$= -\frac{1}{2} \left(\sigma^2\right)^{-1} + \frac{1}{2} \left(\sigma^2\right)^{-2} \text{var}x.$$
(1.52)

Therefore,

$$var x = \sigma^2. (1.53)$$

#### 1.9

Let

$$\mathcal{N}\left(x|\mu,\sigma^2\right) = \left(2\pi\sigma^2\right)^{-\frac{1}{2}} \exp\left(-\frac{1}{2\sigma^2}(x-\mu)^2\right). \tag{1.54}$$

Setting its derivative with respect to x to zero gives

$$0 = (2\pi\sigma^2)^{-\frac{1}{2}} \left( -\frac{1}{\sigma^2} (x - \mu) \right) \exp\left( -\frac{1}{2\sigma^2} (x - \mu)^2 \right). \tag{1.55}$$

Therefore, the mode is given by  $\mu$ .

Similarly, let

$$\mathcal{N}(\mathbf{x}|\boldsymbol{\mu},\boldsymbol{\Sigma}) = (2\pi)^{-\frac{D}{2}} |\boldsymbol{\Sigma}|^{-\frac{1}{2}} \exp\left(-\frac{1}{2}(\mathbf{x}-\boldsymbol{\mu})^{\mathsf{T}}\boldsymbol{\Sigma}^{-1}(\mathbf{x}-\boldsymbol{\mu})\right). \tag{1.56}$$

Setting its derivative with respect to  $\mathbf{x}$  to zero gives

$$\mathbf{0} = -(2\pi)^{-\frac{D}{2}} |\mathbf{\Sigma}|^{-\frac{1}{2}} \left(\mathbf{\Sigma}^{-1} + \left(\mathbf{\Sigma}^{-1}\right)^{\mathsf{T}}\right) (\mathbf{x} - \boldsymbol{\mu}) \exp\left(-\frac{1}{2} (\mathbf{x} - \boldsymbol{\mu})^{\mathsf{T}} \mathbf{\Sigma}^{-1} (\mathbf{x} - \boldsymbol{\mu})\right).$$

$$(1.57)$$

Therefore, the mode is given by  $\mu$ .

#### 1.10

By the definition,

$$E(x+y) = \int \int (x+y)p(x,y)dxdy.$$
 (1.58)

The right hand side can be written as

$$\int x \left( \int p(x,y)dy \right) dx + \int y \left( \int p(x,y)dx \right) dy = \int x p(x)dx + \int y p(y)dy.$$
(1.59)

By the definition, the right hand side can be written as

$$\mathbf{E}x + \mathbf{E}y. \tag{1.60}$$

Therefore,

$$E(x+y) = Ex + Ey. (1.61)$$

Similarly, by the definition,

$$var(x+y) = E(x+y - E(x+y))^{2}$$
(1.62)

By the result above and the definition, the right hand side can be written as

$$E(x - Ex)^{2} + 2E((x - Ex)(y - Ey)) + E(y - Ey)^{2}$$

$$= varx + 2cov(x, y) + vary.$$
(1.63)

If x and y are independent, then

$$cov(x,y) = 0, (1.64)$$

by 1.6. Therefore,

$$var(x+y) = var x + var y. (1.65)$$

#### 1.11

Let

$$\ln p\left(\mathbf{x}|\mu,\sigma^{2}\right) = -\frac{N}{2}\ln\left(2\pi\sigma^{2}\right) - \frac{1}{2\sigma^{2}}\sum_{n=1}^{N}(x_{n}-\mu)^{2}.$$
 (1.66)

To maximise it with respect to  $\mu$  and  $\sigma^2$ , setting the partial derivatives to zero gives

$$0 = \frac{1}{\sigma^2} \sum_{n=1}^{N} (x_n - \mu),$$

$$0 = -\frac{N}{2\sigma^2} + \frac{1}{2(\sigma^2)^2} \sum_{n=1}^{N} (x_n - \mu)^2.$$
(1.67)

Therefore,

$$\mu_{\rm ML} = \frac{1}{N} \sum_{n=1}^{N} x_n,$$

$$\sigma_{\rm ML}^2 = \frac{1}{N} \sum_{n=1}^{N} (x_n - \mu_{\rm ML})^2.$$
(1.68)

#### 1.12

Let  $x_m$  and  $x_n$  be independent variables. Then

$$Ex_m x_n = Ex_m Ex_n. (1.69)$$

If they are samples from the Gaussian distribution with mean  $\mu$  and variance  $\sigma^2$ , the right hand side is given by  $\mu^2$ . On the other hand, by the definition,

$$Ex_n^2 = var x_n + (Ex_n)^2. (1.70)$$

If  $x_n$  is a sample from the Gaussian distribution with mean  $\mu$  and variance  $\sigma^2$ , the right hand side is given by  $\sigma^2 + \mu^2$ . Therefore,

$$Ex_m x_n = \mu^2 + \delta_{mn} \sigma^2. \tag{1.71}$$

Here, since

$$\mu_{\rm ML} = \frac{1}{N} \sum_{n=1}^{N} x_n, \tag{1.72}$$

we have

$$E\mu_{ML} = \frac{1}{N} \sum_{n=1}^{N} Ex_n.$$
 (1.73)

Therefore,

$$E\mu_{ML} = \mu. (1.74)$$

Similarly, since

$$\sigma_{\rm ML}^2 = \frac{1}{N} \sum_{n=1}^{N} (x_n - \mu_{\rm ML})^2,$$
 (1.75)

we have

$$E\sigma_{ML}^2 = \frac{1}{N} \sum_{n=1}^{N} E(x_n - \mu_{ML})^2.$$
 (1.76)

The right hand side can be writen as

$$\frac{1}{N} \sum_{n=1}^{N} E\left(x_n^2 - 2\mu_{\text{ML}}x_n + \mu_{\text{ML}}^2\right) = \frac{1}{N} \sum_{n=1}^{N} Ex_n^2 - \frac{2}{N} E\left(\mu_{\text{ML}}\left(\sum_{n=1}^{N} x_n\right)\right) + E\mu_{\text{ML}}^2.$$
(1.77)

The first term of the right hand side can be written as

$$\frac{1}{N} \sum_{n=1}^{N} (\mu^2 + \sigma^2) = \mu^2 + \sigma^2, \tag{1.78}$$

while the second and third terms can be writen as

$$-2E\mu_{\rm ML}^2 + E\mu_{\rm ML}^2 = -E\mu_{\rm ML}^2. \tag{1.79}$$

Here,

$$E\mu_{\rm ML}^2 = E\left(\frac{1}{N}\sum_{n=1}^N x_n\right)^2.$$
 (1.80)

The right hand side can be written as

$$\frac{1}{N^2} \sum_{n=1}^{N} Ex_n^2 + \frac{2}{N^2} \sum_{1 \le m \le n \le N} Ex_m x_n = \frac{1}{N} (\mu^2 + \sigma^2) + \frac{N-1}{N} \mu^2.$$
 (1.81)

Therefore,

$$E\mu_{\rm ML}^2 = \mu^2 + \frac{1}{N}\sigma^2. \tag{1.82}$$

Thus,

$$E\sigma_{\rm ML}^2 = \frac{N-1}{N}\sigma^2. \tag{1.83}$$

#### 1.13

Let  $\{x_n\}$  be a set of variables whose mean is  $\mu$  and variance is  $\sigma^2$ . Then

$$E\left(\frac{1}{N}\sum_{n=1}^{N}(x_n-\mu)^2\right) = \frac{1}{N}\sum_{n=1}^{N}E(x_n-\mu)^2.$$
 (1.84)

The right hand side can be writen as

$$\frac{1}{N} \sum_{n=1}^{N} E\left(x_n^2 - 2\mu x_n + \mu^2\right) = \frac{1}{N} \sum_{n=1}^{N} Ex_n^2 - \frac{2\mu}{N} \sum_{n=1}^{N} Ex_n + \mu^2.$$
 (1.85)

The first term of the right hand side can be written as

$$\frac{1}{N} \sum_{n=1}^{N} (\mu^2 + \sigma^2) = \mu^2 + \sigma^2, \tag{1.86}$$

while the second term can be writen as

$$-\frac{2\mu}{N}\sum_{n=1}^{N}\mu = -2\mu^2. \tag{1.87}$$

Therefore,

$$E\left(\frac{1}{N}\sum_{n=1}^{N}(x_{n}-\mu)^{2}\right) = \sigma^{2}.$$
(1.88)

#### 1.14

Let

$$w_{ij}^{S} = \frac{1}{2}(w_{ij} + w_{ji}),$$

$$w_{ij}^{A} = \frac{1}{2}(w_{ij} - w_{ji}).$$
(1.89)

Then

$$w_{ij} = w_{ij}^{S} + w_{ij}^{A},$$
  
 $w_{ij}^{S} = w_{ji}^{S},$   
 $w_{ij}^{A} = -w_{ji}^{A}.$  (1.90)

Here,

$$\sum_{i=1}^{D} \sum_{j=1}^{D} w_{ij}^{A} x_i x_j = \frac{1}{2} \sum_{i=1}^{D} \sum_{j=1}^{D} (w_{ij} - w_{ji}) x_i x_j.$$
 (1.91)

The right hand side can be written as

$$\frac{1}{2} \left( \sum_{i=1}^{D} \sum_{j=1}^{D} w_{ij} x_i x_j - \sum_{i=1}^{D} \sum_{j=1}^{D} w_{ji} x_i x_j \right) = 0.$$
 (1.92)

$$\sum_{i=1}^{D} \sum_{j=1}^{D} w_{ij}^{A} x_i x_j = 0.$$
 (1.93)

Additionally,

$$\sum_{i=1}^{D} \sum_{j=1}^{D} w_{ij} x_i x_j = \sum_{i=1}^{D} \sum_{j=1}^{D} \left( w_{ij}^{S} + w_{ij}^{A} \right) x_i x_j.$$
 (1.94)

The right hand side can be written as

$$\sum_{i=1}^{D} \sum_{j=1}^{D} w_{ij}^{S} x_i x_j + \sum_{i=1}^{D} \sum_{j=1}^{D} w_{ij}^{A} x_i x_j = \sum_{i=1}^{D} \sum_{j=1}^{D} w_{ij}^{S} x_i x_j,$$
 (1.95)

where the result above is used. Therefore,

$$\sum_{i=1}^{D} \sum_{j=1}^{D} w_{ij} x_i x_j = \sum_{i=1}^{D} \sum_{j=1}^{D} w_{ij}^{S} x_i x_j.$$
 (1.96)

Finally, since the matrix  $w^{\rm S}_{ij}$  is  $D\times D$  symmetric matrix, its number of independent parameters is  $\frac{D(D+1)}{2}$ .

#### 1.15 (Incomplete)

## 1.16 (Incomplete)

#### 1.17

Let

$$\Gamma(x) = \int_0^\infty u^{x-1} \exp(-u) du. \tag{1.97}$$

Then

$$\Gamma(x+1) = \int_0^\infty u^x \exp(-u) du.$$
 (1.98)

The right hand side can be written as

$$[-u^{x} \exp(-u)]_{u=0}^{u=\infty} + \int_{0}^{\infty} x u^{x-1} \exp(-u) du = x\Gamma(x).$$
 (1.99)

$$\Gamma(x+1) = x\Gamma(x). \tag{1.100}$$

Since

$$\Gamma(1) = \int_0^1 \exp(-u)du,$$
 (1.101)

and the right hand side can be written as 1,

$$\Gamma(1) = 0!. \tag{1.102}$$

For a positive integer x, let us assume that

$$\Gamma(x) = (x - 1)!. \tag{1.103}$$

Then,

$$\Gamma(x+1) = x\Gamma(x),\tag{1.104}$$

where the right hand side can be written as

$$x(x-1)! = x!. (1.105)$$

Therefore,

$$\Gamma(x+1) = x!. \tag{1.106}$$

Thus, the assumption is proved by induction on x.

#### 1.18

Let us consider the transformation from Cartesian to polar coordinates

$$\prod_{i=1}^{D} \int_{-\infty}^{\infty} \exp(-x_i^2) dx_i = S_D \int_{0}^{\infty} \exp(-r^2) r^{D-1} dr, \qquad (1.107)$$

where  $S_D$  is the surface area of a sphere of unit raidus in D dimensions. By 1.7, the left hand side can be written as  $\pi^{\frac{D}{2}}$ . By the transformation  $s = r^2$ , the right hand side can be written as

$$\frac{S_D}{2} \int_0^\infty \exp(-s) s^{\frac{D-1}{2}} s^{-\frac{1}{2}} ds = \frac{S_D}{2} \Gamma\left(\frac{D}{2}\right). \tag{1.108}$$

$$S_D = \frac{2\pi^{\frac{D}{2}}}{\Gamma\left(\frac{D}{2}\right)}. (1.109)$$

Additionally, the volume of the sphere can can be written as

$$V_D = S_D \int_0^1 r^{D-1} dr. (1.110)$$

The right hand side can be written as

$$S_D \left[ \frac{r^D}{D} \right]_{r=0}^{r=1} = \frac{S_D}{D}. \tag{1.111}$$

Therefore,

$$V_D = \frac{S_D}{D}. ag{1.112}$$

Finally, the results above reduce to

$$S_2 = \frac{2\pi}{\Gamma(1)},$$
 (1.113)  $V_2 = \frac{S_2}{2}.$ 

Therefore,

$$S_2 = 2\pi,$$
  
 $V_2 = \pi.$  (1.114)

Similarly,

$$S_{3} = \frac{2\pi^{\frac{3}{2}}}{\Gamma(\frac{3}{2})},$$

$$V_{3} = \frac{S_{3}}{3}.$$
(1.115)

Therefore,

$$S_3 = 4\pi,$$

$$V_3 = \frac{4}{3}\pi.$$
(1.116)

#### 1.19

The volume of a cube of side 2 in D dimensions is  $2^{D}$ . Therefore, the ratio of the volume of the cocentric sphere of radius 1 divided by the volume of the cube is given by

$$\frac{V_D}{2^D} = \frac{\pi^{\frac{D}{2}}}{D2^{D-1}\Gamma(\frac{D}{2})},\tag{1.117}$$

by 1.18.

Additionally, by Stering's formula

$$\Gamma(x+1) \simeq (2\pi)^{\frac{1}{2}} \exp(-x)x^{\frac{x+1}{2}},$$
 (1.118)

the ratio can be approximated as

$$\frac{V_D}{2^D} \simeq \frac{\pi^{\frac{D}{2}}}{D2^{D-1}(2\pi)^{\frac{1}{2}} \exp\left(1 - \frac{D}{2}\right) \left(\frac{D}{2} - 1\right)^{\frac{D}{4}}}.$$
 (1.119)

The right hand side can be written as

$$\frac{1}{2e(2\pi)^{\frac{1}{2}}} \frac{1}{D} \left( \frac{e^2 \pi^2}{8D - 16} \right)^{\frac{D}{4}}.$$
 (1.120)

Therefore, the ratio goes to zero as  $D \to \infty$ .

Finally, the ratio of the distance from the center of the cube to one of the corners divided by the perpendicular distance to one of the sides is given by

$$\frac{\sqrt{\sum_{i=1}^{D} 1^2}}{1} = \sqrt{D}.\tag{1.121}$$

Therefore, the ration goes to  $\infty$  as  $D \to \infty$ .

#### 1.20

For a vector  $\mathbf{x}$  in D dimensions, let

$$p(\mathbf{x}) = (2\pi\sigma^2)^{-\frac{D}{2}} \exp\left(-\frac{\|\mathbf{x}\|^2}{2\sigma^2}\right). \tag{1.122}$$

Integrating both sides from  $\|\mathbf{x}\| = r$  to  $\|\mathbf{x}\| = r + \epsilon$  gives

$$\int_{r<\|\mathbf{x}\|< r+\epsilon} p(\mathbf{x}) d\mathbf{x} = \int_{r}^{r+\epsilon} \int (2\pi\sigma^2)^{-\frac{D}{2}} \exp\left(-\frac{r'^2}{2\sigma^2}\right) J dr' d\boldsymbol{\phi}, \qquad (1.123)$$

where  $\phi$  is the vector of the angular components of the polar coordinate and J is the Jacobian of the transformation from the Cartesian to polar coordinate.

For a sufficiently small  $\epsilon$ , the right hand side can be approximated as

$$(2\pi\sigma^2)^{-\frac{D}{2}} \exp\left(-\frac{r^2}{2\sigma^2}\right) \int_r^{r+\epsilon} \int J dr' d\phi$$

$$= (2\pi\sigma^2)^{-\frac{D}{2}} \exp\left(-\frac{r^2}{2\sigma^2}\right) \int_{r<\|\mathbf{x}\|< r+\epsilon} d\mathbf{x}.$$
(1.124)

Therefore,

$$\int_{r \le \|\mathbf{x}\| \le r + \epsilon} p(\mathbf{x}) d\mathbf{x} \simeq p(r) \epsilon, \qquad (1.125)$$

where

$$p(r) = (2\pi\sigma^2)^{-\frac{D}{2}} S_D r^{D-1} \exp\left(-\frac{r^2}{2\sigma^2}\right),$$
 (1.126)

and  $S_D$  is the surface area of a unit sphere in D dimensions.

Secondly, to maximise p(r), setting the derivative to zero gives

$$0 = (2\pi\sigma^2)^{-\frac{D}{2}} S_D \left( (D-1)r^{D-2} - \frac{r^D}{\sigma^2} \right) \exp\left( -\frac{r^2}{2\sigma^2} \right). \tag{1.127}$$

Therefore, p(r) is maximised at a sigle stationary point

$$\hat{r} = \sqrt{D - 1}\sigma. \tag{1.128}$$

Thirdly, by the expression of p(r) above,

$$\frac{p(\hat{r}+\epsilon)}{p(\hat{r})} = \left(\frac{\hat{r}+\epsilon}{\hat{r}}\right)^{D-1} \exp\left(-\frac{2\hat{r}\epsilon+\epsilon^2}{2\sigma^2}\right). \tag{1.129}$$

Using the expression of  $\hat{r}$  above, the right hand side can be written as

$$\exp\left((D-1)\ln\left(1+\frac{\epsilon}{\hat{r}}\right) - \frac{2\hat{r}\epsilon + \epsilon^2}{2\sigma^2}\right)$$

$$= \exp\left(\frac{\hat{r}^2}{\sigma^2}\ln\left(1+\frac{\epsilon}{\hat{r}}\right) - \frac{2\hat{r}\epsilon + \epsilon^2}{2\sigma^2}\right). \tag{1.130}$$

By the Taylor series

$$\ln(1+x) = x - \frac{1}{2}x^2 + o(x^3), \qquad (1.131)$$

the right hand side can be approximated as

$$\exp\left(\frac{\hat{r}^2}{\sigma^2}\left(\frac{\epsilon}{\hat{r}} - \frac{\epsilon^2}{2\hat{r}^2}\right) - \frac{2\hat{r}\epsilon + \epsilon^2}{2\sigma^2}\right) = \exp\left(-\frac{\epsilon^2}{\sigma^2}\right). \tag{1.132}$$

Therefore,

$$p(\hat{r} + \epsilon) \simeq p(\hat{r}) \exp\left(-\frac{\epsilon^2}{\sigma^2}\right).$$
 (1.133)

Finally, let a vector of length  $\hat{r}$  be  $\hat{\mathbf{r}}$ . Then, by the definition of  $p(\mathbf{x})$ ,

$$\frac{p(\mathbf{0})}{p(\hat{\mathbf{r}})} = \exp\left(\frac{\hat{r}^2}{2\sigma^2}\right). \tag{1.134}$$

Substituting the expression of  $\hat{r}$  above, the right hand side can be written as  $\exp\left(\frac{D-1}{2}\right)$ . Therefore,

$$\frac{p(\mathbf{0})}{p(\hat{\mathbf{r}})} = \exp\left(\frac{D-1}{2}\right). \tag{1.135}$$

#### 1.21

If  $0 \le a \le b$ , then

$$0 \le a(b-a). \tag{1.136}$$

Therefore,

$$a \le (ab)^{\frac{1}{2}}. (1.137)$$

For a two-class classification problem of  $\mathbf{x}$ , let the classes be  $\mathcal{C}_1$  and  $\mathcal{C}_2$  and let the decision regions be  $\mathcal{R}_1$  and  $\mathcal{R}_2$ . Let us choose the decision regions to minimise the probability of misclassification. Then,

$$p(\mathbf{x}, \mathcal{C}_1) > p(\mathbf{x}, \mathcal{C}_2) \Rightarrow \mathbf{x} \in \mathcal{C}_1,$$
 (1.138)

and

$$p(\mathbf{x}, \mathcal{C}_2) > p(\mathbf{x}, \mathcal{C}_1) \Rightarrow \mathbf{x} \in \mathcal{C}_2.$$
 (1.139)

Then, using the inequality above,

$$\int_{\mathcal{R}_1} p(\mathbf{x}, \mathcal{C}_2) d\mathbf{x} \le \int_{\mathcal{R}_1} \left( p(\mathbf{x}, \mathcal{C}_1) p(\mathbf{x}, \mathcal{C}_2) \right)^{\frac{1}{2}} d\mathbf{x}, \tag{1.140}$$

and

$$\int_{\mathcal{R}_2} p(\mathbf{x}, \mathcal{C}_1) d\mathbf{x} \le \int_{\mathcal{R}_2} \left( p(\mathbf{x}, \mathcal{C}_1) p(\mathbf{x}, \mathcal{C}_2) \right)^{\frac{1}{2}} d\mathbf{x}. \tag{1.141}$$

$$\int_{\mathcal{R}_1} p(\mathbf{x}, \mathcal{C}_2) d\mathbf{x} + \int_{\mathcal{R}_2} p(\mathbf{x}, \mathcal{C}_1) d\mathbf{x} \le \int \left( p(\mathbf{x}, \mathcal{C}_1) p(\mathbf{x}, \mathcal{C}_2) \right)^{\frac{1}{2}} d\mathbf{x}.$$
 (1.142)

Let

$$EL = \sum_{k} \sum_{j} \int_{\mathcal{R}_{j}} L_{kj} p(\mathbf{x}, \mathcal{C}_{k}) d\mathbf{x}.$$
 (1.143)

If

$$L_{kj} = 1 - \delta_{kj},\tag{1.144}$$

then the right hand side can be written as

$$\sum_{k} \sum_{j} \int_{\mathcal{R}_{j}} \left( p(\mathbf{x}, \mathcal{C}_{k}) - p(\mathbf{x}, \mathcal{C}_{j}) \right) d\mathbf{x} = \sum_{j} \int_{\mathcal{R}_{j}} \left( \sum_{k} p(\mathbf{x}, \mathcal{C}_{k}) - p(\mathbf{x}, \mathcal{C}_{j}) \right) d\mathbf{x}.$$
(1.145)

The right hand side can be written as

$$\sum_{j} \int_{\mathcal{R}_{j}} (p(\mathbf{x}) - p(\mathbf{x}, \mathcal{C}_{j})) d\mathbf{x} = 1 - \sum_{j} \int_{\mathcal{R}_{j}} p(\mathbf{x}, \mathcal{C}_{j}) d\mathbf{x}.$$
 (1.146)

Therefore,

$$EL = 1 - \sum_{i} \int_{\mathcal{R}_{j}} p(\mathcal{C}_{j}|\mathbf{x}) p(\mathbf{x}) d\mathbf{x}.$$
 (1.147)

Thus, minimising EL reduces to choosing the criterion to maximise the posterior probatility  $p(C_j|\mathbf{x})$ .

#### 1.23

Let

$$EL = \sum_{k} \sum_{j} \int_{\mathcal{R}_{j}} L_{kj} p(\mathbf{x}, \mathcal{C}_{k}) d\mathbf{x}.$$
 (1.148)

The right hand side can be written as

$$\sum_{j} \int_{\mathcal{R}_{j}} \sum_{k} L_{kj} p(\mathbf{x}, \mathcal{C}_{k}) d\mathbf{x} = \sum_{j} \int_{\mathcal{R}_{j}} \left( \sum_{k} L_{kj} p(\mathcal{C}_{k} | \mathbf{x}) \right) p(\mathbf{x}) d\mathbf{x}.$$
 (1.149)

Therefore.

$$EL = \sum_{j} \int_{\mathcal{R}_{j}} \left( \sum_{k} L_{kj} p(\mathcal{C}_{k} | \mathbf{x}) \right) p(\mathbf{x}) d\mathbf{x}.$$
 (1.150)

Thus, mimising EL reduces to choosing to minimise  $\sum_k L_{kj} p(\mathcal{C}_k | \mathbf{x})$ .

#### 1.24 (Incomplete)

#### 1.25

Let

$$EL(\mathbf{t}, \mathbf{y}(\mathbf{x})) = \int \int ||\mathbf{y}(\mathbf{x}) - \mathbf{t}||^2 p(\mathbf{x}, \mathbf{t}) d\mathbf{x} d\mathbf{t}.$$
 (1.151)

Then

$$\frac{\delta EL(\mathbf{t}, \mathbf{y}(\mathbf{x}))}{\delta \mathbf{y}(\mathbf{x})} = 2 \int (\mathbf{y}(\mathbf{x}) - \mathbf{t}) p(\mathbf{x}, \mathbf{t}) d\mathbf{t}.$$
 (1.152)

To minimise  $EL(\mathbf{t}, \mathbf{y}(\mathbf{x}))$ , setting the left hand side to zero gives

$$\mathbf{0} = \int (\mathbf{y}(\mathbf{x}) - \mathbf{t}) p(\mathbf{t}|\mathbf{x}) d\mathbf{t}.$$
 (1.153)

The right hand side can be written as

$$\mathbf{y}(\mathbf{x}) \int p(\mathbf{t}|\mathbf{x})d\mathbf{t} - \int \mathbf{t}p(\mathbf{t}|\mathbf{x})d\mathbf{t} = \mathbf{y}(\mathbf{x}) - \mathbf{E}_{\mathbf{t}}(\mathbf{t}|\mathbf{x}).$$
 (1.154)

Thus,

$$\mathbf{y}(\mathbf{x}) = \mathbf{E}_{\mathbf{t}}(\mathbf{t}|\mathbf{x}). \tag{1.155}$$

Finally, for a single target variable t, it reduces to

$$\mathbf{y}(\mathbf{x}) = \mathbf{E}_t(t|\mathbf{x}). \tag{1.156}$$

#### 1.26

Let

$$EL(\mathbf{t}, \mathbf{y}(\mathbf{x})) = \int \int ||\mathbf{y}(\mathbf{x}) - \mathbf{t}||^2 p(\mathbf{x}, \mathbf{t}) d\mathbf{x} d\mathbf{t}.$$
 (1.157)

The right hand side can be written as

$$\int \int \|\mathbf{y}(\mathbf{x}) - \mathbf{E}_{\mathbf{t}}(\mathbf{t}|\mathbf{x}) + \mathbf{E}_{\mathbf{t}}(\mathbf{t}|\mathbf{x}) - \mathbf{t}\|^{2} p(\mathbf{x}, \mathbf{t}) d\mathbf{x} d\mathbf{t} 
= \int \int \|\mathbf{y}(\mathbf{x}) - \mathbf{E}_{\mathbf{t}}(\mathbf{t}|\mathbf{x})\|^{2} p(\mathbf{x}, \mathbf{t}) d\mathbf{x} d\mathbf{t} 
+ 2 \int \int (\mathbf{y}(\mathbf{x}) - \mathbf{E}_{\mathbf{t}}(\mathbf{t}|\mathbf{x}))^{\mathsf{T}} (\mathbf{E}_{\mathbf{t}}(\mathbf{t}|\mathbf{x}) - \mathbf{t}) p(\mathbf{x}, \mathbf{t}) d\mathbf{x} d\mathbf{t} 
+ \int \int \|\mathbf{E}_{\mathbf{t}}(\mathbf{t}|\mathbf{x}) - \mathbf{t}\|^{2} p(\mathbf{x}, \mathbf{t}) d\mathbf{x} d\mathbf{t}.$$
(1.158)

Let us look at each term of the right hand side. The first term can be written as

$$\int \|\mathbf{y}(\mathbf{x}) - \mathbf{E}_{\mathbf{t}}(\mathbf{t}|\mathbf{x})\|^{2} \left( \int p(\mathbf{x}, \mathbf{t}) d\mathbf{t} \right) d\mathbf{x} = \int \|\mathbf{y}(\mathbf{x}) - \mathbf{E}_{\mathbf{t}}(\mathbf{t}|\mathbf{x})\|^{2} p(\mathbf{x}) d\mathbf{x}.$$
(1.159)

The second term can be written as

$$2\int (\mathbf{y}(\mathbf{x}) - \mathbf{E}_{\mathbf{t}}(\mathbf{t}|\mathbf{x}))^{\mathsf{T}} \left( \int (\mathbf{E}_{\mathbf{t}}(\mathbf{t}|\mathbf{x}) - \mathbf{t}) p(\mathbf{t}|\mathbf{x}) d\mathbf{t} \right) p(\mathbf{x}) d\mathbf{x}.$$
 (1.160)

Since

$$\int E_{\mathbf{t}}(\mathbf{t}|\mathbf{x})p(\mathbf{t}|\mathbf{x})d\mathbf{t} = E_{\mathbf{t}}(\mathbf{t}|\mathbf{x})\frac{\int p(\mathbf{x},\mathbf{t})d\mathbf{t}}{p(\mathbf{x})},$$

$$\int \mathbf{t}p(\mathbf{t}|\mathbf{x})d\mathbf{t} = E_{\mathbf{t}}(\mathbf{t}|\mathbf{x}),$$
(1.161)

the second term is zero. The third term can be written as

$$\int \left( \int \|\mathbf{E}_{\mathbf{t}}(\mathbf{t}|\mathbf{x}) - \mathbf{t}\|^2 p(\mathbf{t}|\mathbf{x}) d\mathbf{t} \right) p(\mathbf{x}) d\mathbf{x} = \int \operatorname{var}_{\mathbf{t}}(\mathbf{t}|\mathbf{x}) p(\mathbf{x}) d\mathbf{x}.$$
 (1.162)

Therefore,

$$EL(\mathbf{t}, \mathbf{y}(\mathbf{x})) = \int ||\mathbf{y}(\mathbf{x}) - E_{\mathbf{t}}(\mathbf{t}|\mathbf{x})||^{2} p(\mathbf{x}) d\mathbf{x} + \int var_{\mathbf{t}}(\mathbf{t}|\mathbf{x}) p(\mathbf{x}) d\mathbf{x}. \quad (1.163)$$

Thus,  $EL(\mathbf{t}, \mathbf{y}(\mathbf{x}))$  is mimimised if

$$\mathbf{y}(\mathbf{x}) = \mathbf{E}_{\mathbf{t}}(\mathbf{t}|\mathbf{x}). \tag{1.164}$$

#### 1.27

Let

$$EL_q = \int \int |y(\mathbf{x}) - t|^q p(\mathbf{x}, t) d\mathbf{x} dt.$$
 (1.165)

Then

$$\frac{\delta E L_q}{\delta y(\mathbf{x})} = \int q|y(\mathbf{x}) - t|^{q-1} \operatorname{sign}(y(\mathbf{x}) - t) p(\mathbf{x}, t) dt.$$
 (1.166)

To minimise  $EL_q$ , setting the left hand side to zero gives

$$0 = \int |y(\mathbf{x}) - t|^{q-1} \operatorname{sign}(y(\mathbf{x}) - t) p(t|\mathbf{x}) dt.$$
 (1.167)

This is the condition that  $y(\mathbf{x})$  must satisfy in order to minimise  $\mathrm{E}L_q$ . If q=1, the condition can be written as

$$0 = \int_{y(\mathbf{x})}^{\infty} p(t|\mathbf{x})dt - \int_{-\infty}^{y(\mathbf{x})} p(t|\mathbf{x})dt.$$
 (1.168)

Therefore,  $y(\mathbf{x})$  is given by the conditional median.

#### 1.28

Let us assume that

$$p(x,y) = p(x)p(y) \Rightarrow h(x,y) = h(x) + h(y).$$
 (1.169)

Let h(p) be a function to relate h and p. Then

$$h(p^2) = h(p) + h(p).$$
 (1.170)

Therefore,

$$h\left(p^2\right) = 2h(p). \tag{1.171}$$

Let us assume that, for a positive integer n,

$$h\left(p^{n}\right) = nh(p). \tag{1.172}$$

Then, by the first assumption,

$$h(p^{n+1}) = h(p^n) + h(p).$$
 (1.173)

Therefore,

$$h(p^{n+1}) = (n+1)h(p).$$
 (1.174)

Thus, the second assumption is proved by induction on n.

Additionally, for positive integers m and n,

$$h\left(p^{n}\right) = h\left(p^{\frac{n}{m}m}\right). \tag{1.175}$$

By the second assumption, the left hand side can be written as nh(p). By the first assumption, the right hand side can be written as  $mh(p)^{\frac{n}{m}}$ . Therefore,

$$h\left(p^{\frac{n}{m}}\right) = \frac{n}{m}h(p). \tag{1.176}$$

Finally, by the continuity, for a positive real number a,

$$h\left(p^{a}\right) = ah(p). \tag{1.177}$$

Differentiating both sides with respect to a and substituting a = 1 gives

$$(p \ln p)h'(p) = h(p).$$
 (1.178)

Therefore,

$$\int \frac{h'(p)}{h(p)} dp = \int \frac{1}{p \ln p} dp + C, \qquad (1.179)$$

where C is a constant. Ignorting the constants, the left hand side can be written as  $\ln h(p)$  and the right hand side can be written as  $\ln (\ln p)$ . Thus,

$$h(p) \propto \ln p. \tag{1.180}$$

#### 1.29

Let x be an M-state discrete random variable. Then, by the definition,

$$H(x) = -\sum_{i=1}^{M} p(x_i) \ln p(x_i), \qquad (1.181)$$

where

$$\sum_{i=1}^{M} p(x_i) = 1. (1.182)$$

By Jensen's inequality,

$$\sum_{i=1}^{M} p(x_i) \ln \frac{1}{p(x_i)} \le \ln \left( \sum_{i=1}^{M} 1 \right).$$
 (1.183)

$$H(x) \le \ln M. \tag{1.184}$$

Let

$$p(x) = \mathcal{N}(x|\mu, \sigma^2),$$
  

$$q(x) = \mathcal{N}(x|m, s^2).$$
(1.185)

Then, by the definition,

$$KL(p||q) = -\int p(x) \ln \frac{q(x)}{p(x)} dx. \qquad (1.186)$$

The right hand side can be written as

$$-\int_{-\infty}^{\infty} p(x) \ln \frac{(2\pi s^2)^{-\frac{1}{2}} \exp\left(-\frac{(x-m)^2}{2s^2}\right)}{(2\pi\sigma^2)^{-\frac{1}{2}} \exp\left(-\frac{(x-\mu)^2}{2\sigma^2}\right)} dx$$

$$= -\int_{-\infty}^{\infty} p(x) \left(-\frac{1}{2} \ln \frac{s^2}{\sigma^2} - \frac{(x-m)^2}{2s^2} + \frac{(x-\mu)^2}{2\sigma^2}\right) dx.$$
(1.187)

The right hand side can be written as

$$\ln \frac{s}{\sigma} \int_{-\infty}^{\infty} p(x)dx + \frac{1}{2s^2} \int_{-\infty}^{\infty} (x-m)^2 p(x)dx - \frac{1}{2\sigma^2} \int_{-\infty}^{\infty} (x-\mu)^2 p(x)dx. \quad (1.188)$$

The first term can be written as  $\ln \frac{s}{\sigma}$ . The second term can be written as

$$\frac{1}{2s^2} \int_{-\infty}^{\infty} (x - \mu + \mu - m)^2 p(x) dx = \frac{\sigma^2 + (\mu - m)^2}{2s^2}.$$
 (1.189)

The third term can be written as  $-\frac{1}{2}$ . Therefore,

$$KL(p||q) = \ln \frac{s}{\sigma} + \frac{\sigma^2 + (\mu - m)^2}{2s^2} - \frac{1}{2}.$$
 (1.190)

#### 1.31

Let  $\mathbf{x}$  and  $\mathbf{y}$  be two variables. Then, by the definition,

$$H(\mathbf{x}) = -\int p(\mathbf{x}) \ln p(\mathbf{x}) d\mathbf{x},$$

$$H(\mathbf{y}) = -\int p(\mathbf{y}) \ln p(\mathbf{y}) d\mathbf{y},$$

$$H(\mathbf{x}, \mathbf{y}) = -\int \int p(\mathbf{x}, \mathbf{y}) \ln p(\mathbf{x}, \mathbf{y}) d\mathbf{x} d\mathbf{y}.$$
(1.191)

Note that

$$H(\mathbf{x}) = -\int \left(\int p(\mathbf{x}, \mathbf{y}) d\mathbf{y}\right) \ln p(\mathbf{x}) d\mathbf{x},$$

$$H(\mathbf{y}) = -\int \left(\int p(\mathbf{x}, \mathbf{y}) d\mathbf{x}\right) \ln p(\mathbf{y}) d\mathbf{y}.$$
(1.192)

Therefore,

$$H(\mathbf{x}) + H(\mathbf{y}) - H(\mathbf{x}, \mathbf{y}) = -\int \int p(\mathbf{x}, \mathbf{y}) \ln \frac{p(\mathbf{x})p(\mathbf{y})}{p(\mathbf{x}, \mathbf{y})} d\mathbf{x} d\mathbf{y}.$$
 (1.193)

Since

$$\int \int p(\mathbf{x}, \mathbf{y}) d\mathbf{x} d\mathbf{y} = 1, \tag{1.194}$$

Jensen's inequality can be used to write that

$$-\int \int p(\mathbf{x}, \mathbf{y}) \ln \frac{p(\mathbf{x})p(\mathbf{y})}{p(\mathbf{x}, \mathbf{y})} d\mathbf{x} d\mathbf{y} \ge -\ln \left( \int \int p(\mathbf{x})p(\mathbf{y}) d\mathbf{x} d\mathbf{y} \right). \quad (1.195)$$

The right hand side can be written as

$$-\ln\left(\int p(\mathbf{x})d\mathbf{x}\int p(\mathbf{y})d\mathbf{y}\right) = 0. \tag{1.196}$$

Thus,

$$H(\mathbf{x}, \mathbf{y}) \le H(\mathbf{x}) + H(\mathbf{y}). \tag{1.197}$$

#### 1.32

Let  $\mathbf{x}$  be a vector of continuous variables and

$$\mathbf{y} = \mathbf{A}\mathbf{x},\tag{1.198}$$

where  $\mathbf{A}$  is a nonsingular matrix. By the definition,

$$H(\mathbf{y}) = -\int p_y(\mathbf{y}) \ln p_y(\mathbf{y}) d\mathbf{y}. \tag{1.199}$$

By the transformation

$$p_y(\mathbf{y}) = p_x(\mathbf{A}\mathbf{x}) |\det \mathbf{A}^{-1}|, \qquad (1.200)$$

the right hand side can be written as

$$-\int p_x(\mathbf{A}\mathbf{x}) \ln p_x(\mathbf{A}\mathbf{x}) |\det \mathbf{A}| d\mathbf{x} - \ln \left| \det \mathbf{A}^{-1} \right| \int p_y(\mathbf{y}) d\mathbf{y}. \tag{1.201}$$

By the transformation

$$\mathbf{x}' = \mathbf{A}\mathbf{x},\tag{1.202}$$

the first term can be written as

$$-\int p_x(\mathbf{x}') \ln p_x(\mathbf{x}') d\mathbf{x}' = \mathbf{H}(\mathbf{x}), \qquad (1.203)$$

and the second term can be written as

$$-\ln|\det \mathbf{A}^{-1}| = \ln|\det \mathbf{A}|. \tag{1.204}$$

Therefore,

$$H(\mathbf{y}) = H(\mathbf{x}) + \ln|\det \mathbf{A}|. \tag{1.205}$$

#### 1.33

Let x and y be two discrete random variables. By the definition,

$$H(y|x) = -\sum_{i} \sum_{j} p(x_i, y_j) \ln p(y_j|x_i).$$
 (1.206)

If H(y|x) is zero, then

$$0 = -\sum_{i} p(x_i) \sum_{j} p(y_j | x_i) \ln p(y_j | x_i).$$
 (1.207)

Since

$$p(x_i) \ge 0, p(y_i|x_i) \ln p(y_i|x_i) \le 0.$$
 (1.208)

for all i and j, the equation reduces to

$$p(y_j|x_i) \ln p(y_j|x_i) = 0. (1.209)$$

Therefore,  $p(y_j|x_i)$  is zero or one. Thus, since

$$\sum_{j} p(y_j|x_i) = 1, \tag{1.210}$$

it can be written that

$$p(y_j|x_i) = \delta_{jj'(i)}, \tag{1.211}$$

where j'(i) is unique for each i.

Let

$$L(p(x)) = -\int_{-\infty}^{\infty} p(x) \ln p(x) dx + \lambda_1 \left( \int_{-\infty}^{\infty} p(x) dx - 1 \right) + \lambda_2 \left( \int_{-\infty}^{\infty} x p(x) dx - \mu \right) + \lambda_3 \left( \int_{-\infty}^{\infty} (x - \mu)^2 p(x) dx - \sigma^2 \right).$$
(1.212)

Then

$$\frac{\delta L(p(x))}{\delta p(x)} = \int_{-\infty}^{\infty} \left(-\ln p(x) - 1 + \lambda_1 + \lambda_2 x + \lambda_3 (x - \mu)^2\right) dx. \tag{1.213}$$

Setting the left hand side to zero gives

$$p(x) = \exp(-1 + \lambda_1 + \lambda_2 x + \lambda_3 (x - \mu)^2). \tag{1.214}$$

Therefore,

$$p(x) = \exp\left(-1 + \lambda_1 - \frac{\lambda_2^2}{4\lambda_3} + \lambda_3 \left(x - \left(\mu - \frac{\lambda_2}{2\lambda_3}\right)\right)^2\right). \tag{1.215}$$

Substituting it to

$$\int_{-\infty}^{\infty} p(x)dx = 1,$$

$$\int_{-\infty}^{\infty} xp(x)dx = \mu,$$

$$\int_{-\infty}^{\infty} (x - \mu)^2 p(x)dx = \sigma^2,$$
(1.216)

gives

$$\exp\left(-1 + \lambda_1 - \frac{\lambda_2^2}{4\lambda_3}\right) \int_{-\infty}^{\infty} \exp\left(\lambda_3 \left(x - \left(\mu - \frac{\lambda_2}{2\lambda_3}\right)\right)^2\right) dx = 1,$$

$$\exp\left(-1 + \lambda_1 - \frac{\lambda_2^2}{4\lambda_3}\right) \int_{-\infty}^{\infty} x \exp\left(\lambda_3 \left(x - \left(\mu - \frac{\lambda_2}{2\lambda_3}\right)\right)^2\right) dx = \mu,$$

$$\exp\left(-1 + \lambda_1 - \frac{\lambda_2^2}{4\lambda_3}\right) \int_{-\infty}^{\infty} (x - \mu)^2 \exp\left(\lambda_3 \left(x - \left(\mu - \frac{\lambda_2}{2\lambda_3}\right)\right)^2\right) dx = \sigma^2.$$

$$(1.217)$$

By the transformation

$$y = \sqrt{-\lambda_3} \left( x - \left( \mu - \frac{\lambda_2}{2\lambda_3} \right) \right), \tag{1.218}$$

they can be written as

$$\exp\left(-1 + \lambda_{1} - \frac{\lambda_{2}^{2}}{4\lambda_{3}}\right) \int_{-\infty}^{\infty} \exp\left(-y^{2}\right) (-\lambda_{3})^{-\frac{1}{2}} dy = 1,$$

$$\exp\left(-1 + \lambda_{1} - \frac{\lambda_{2}^{2}}{4\lambda_{3}}\right) \int_{-\infty}^{\infty} \left((-\lambda_{3})^{-\frac{1}{2}} y + \mu - \frac{\lambda_{2}}{2\lambda_{3}}\right) \exp\left(-y^{2}\right) (-\lambda_{3})^{-\frac{1}{2}} dy = \mu,$$

$$\exp\left(-1 + \lambda_{1} - \frac{\lambda_{2}^{2}}{4\lambda_{3}}\right) \int_{-\infty}^{\infty} \left((-\lambda_{3})^{-\frac{1}{2}} y - \frac{\lambda_{2}}{2\lambda_{3}}\right)^{2} \exp\left(-y^{2}\right) (-\lambda_{3})^{-\frac{1}{2}} dy = \sigma^{2}.$$

$$(1.219)$$

Since

$$\int_{-\infty}^{\infty} \exp(-y^2) dy = \Gamma\left(\frac{1}{2}\right),$$

$$\int_{-\infty}^{\infty} y \exp(-y^2) dy = 0,$$

$$\int_{-\infty}^{\infty} y^2 \exp(-y^2) dy = \Gamma\left(\frac{3}{2}\right),$$
(1.220)

they can be written as

$$\exp\left(-1 + \lambda_{1} - \frac{\lambda_{2}^{2}}{4\lambda_{3}}\right) (-\lambda_{3})^{-\frac{1}{2}} \Gamma\left(\frac{1}{2}\right) = 1,$$

$$\exp\left(-1 + \lambda_{1} - \frac{\lambda_{2}^{2}}{4\lambda_{3}}\right) \left(\mu - \frac{\lambda_{2}}{2\lambda_{3}}\right) (-\lambda_{3})^{-\frac{1}{2}} \Gamma\left(\frac{1}{2}\right) = \mu,$$

$$\exp\left(-1 + \lambda_{1} - \frac{\lambda_{2}^{2}}{4\lambda_{3}}\right) \left((-\lambda_{3})^{-\frac{3}{2}} \Gamma\left(\frac{3}{2}\right) + (-\lambda_{3})^{-\frac{1}{2}} \frac{\lambda_{2}^{2}}{4\lambda_{3}^{2}} \Gamma\left(\frac{1}{2}\right)\right) = \sigma^{2}.$$
(1.221)

Thus,

$$\lambda_1 = 1 - \frac{1}{2} \ln \left( 2\pi \sigma^2 \right),$$

$$\lambda_2 = 0,$$

$$\lambda_3 = -\frac{1}{2\sigma^2},$$
(1.222)

so that

$$p(x) = (2\pi\sigma^2)^{-\frac{1}{2}} \exp\left(-\frac{1}{2\sigma^2}(x-\mu)^2\right).$$
 (1.223)

Let x be a variable under the Gaussian distribution with mean  $\mu$  and variance  $\sigma^2$ . Then, by the definition,

$$H(x) = -\int_{-\infty}^{\infty} \mathcal{N}\left(x|\mu, \sigma^2\right) \ln \mathcal{N}\left(x|\mu, \sigma^2\right) dx, \qquad (1.224)$$

where

$$\mathcal{N}\left(x|\mu,\sigma^2\right) = \left(2\pi\sigma^2\right)^{-\frac{1}{2}} \exp\left(-\frac{1}{2\sigma^2}(x-\mu)^2\right). \tag{1.225}$$

Therefore,

$$H(x) = -\int_{-\infty}^{\infty} \mathcal{N}\left(x|\mu,\sigma^2\right) \left(-\frac{1}{2}\ln\left(2\pi\sigma^2\right) - \frac{1}{2\sigma^2}(x-\mu)^2\right) dx. \quad (1.226)$$

The right hand side can be written as

$$\frac{1}{2}\ln\left(2\pi\sigma^2\right)\int_{-\infty}^{\infty}\mathcal{N}\left(x|\mu,\sigma^2\right)dx + \frac{1}{2\sigma^2}\int_{-\infty}^{\infty}(x-\mu)^2\mathcal{N}\left(x|\mu,\sigma^2\right)dx. \quad (1.227)$$

Thus,

$$H(x) = \frac{1}{2} (1 + \ln(2\pi\sigma^2)).$$
 (1.228)

# 1.36 (Incomplete)

Let f be a strictly convex function. Then, by the definition,

$$f(\lambda a + (1 - \lambda)b) \le \lambda f(a) + (1 - \lambda)f(b), \tag{1.229}$$

where  $a \leq b$  and  $0 \leq \lambda \leq 1$ . Let

$$x = \lambda a + (1 - \lambda)b. \tag{1.230}$$

Then, the inequality can be written as

$$f(x) \le \frac{b-x}{b-a}f(a) + \frac{x-a}{b-a}f(b).$$
 (1.231)

Let

$$g(x) = \frac{b-x}{b-a}f(a) + \frac{x-a}{b-a}f(b) - f(x).$$
 (1.232)

Then,

$$g(x) \ge 0. \tag{1.233}$$

Additionally, for x > a,

$$g(x) = (x - a) \left( \frac{f(b) - f(a)}{b - a} - \frac{f(x) - f(a)}{x - a} \right).$$
 (1.234)

By the mean value theorem, there exists c and y such that  $a \leq c \leq b$ ,  $a \leq y \leq x$  and

$$f'(c) = \frac{f(b) - f(a)}{b - a},$$
  

$$f'(y) = \frac{f(x) - f(a)}{x - a}.$$
(1.235)

Then, for x > a, the inequality reduces to

$$f'(y) \le f'(c). \tag{1.236}$$

#### 1.37

Let  $\mathbf{x}$  and  $\mathbf{y}$  be two variables. Then, by the definition,

$$H(\mathbf{x}, \mathbf{y}) = -\int \int p(\mathbf{x}, \mathbf{y}) \ln p(\mathbf{x}, \mathbf{y}) d\mathbf{x} d\mathbf{y}.$$
 (1.237)

The right hand side can be written as

$$-\int \int p(\mathbf{x}, \mathbf{y}) \left( \ln p(\mathbf{y}|\mathbf{x}) + \ln p(\mathbf{x}) \right) d\mathbf{x} d\mathbf{y}$$

$$= -\int \int p(\mathbf{x}, \mathbf{y}) \ln p(\mathbf{y}|\mathbf{x}) d\mathbf{x} d\mathbf{y} - \int \left( \int p(\mathbf{x}, \mathbf{y}) d\mathbf{y} \right) \ln p(\mathbf{x}) d\mathbf{x}.$$
(1.238)

By the definition, the first term of the right hand side can be written as  $H(\mathbf{y}|\mathbf{x})$  and the second term can be written as  $H(\mathbf{x})$ . Therefore,

$$H(\mathbf{x}, \mathbf{y}) = H(\mathbf{y}|\mathbf{x}) + H(\mathbf{x}). \tag{1.239}$$

Let f be a strictly convex function. Then, by the definition,

$$f(\lambda x_1 + (1 - \lambda)x_2) \le \lambda f(x_1) + (1 - \lambda)f(x_2),$$
 (1.240)

where  $0 \le \lambda \le 1$ . Let us assume that

$$f\left(\sum_{i=1}^{M} \lambda_i x_i\right) \le \sum_{i=1}^{M} \lambda_i f(x_i), \tag{1.241}$$

where  $\lambda_i \geq 0$  and

$$\sum_{i=1}^{M} \lambda_i = 1. {(1.242)}$$

Here, let  $\lambda_i \geq 0$  and

$$\sum_{i=1}^{M+1} \lambda_i = 1. \tag{1.243}$$

Then, by the definition,

$$f\left(\sum_{i=1}^{M+1} \lambda_i x_i\right) \le \lambda_{M+1} f(x_{M+1}) + (1 - \lambda_{M+1}) f\left(\sum_{i=1}^{M} \frac{\lambda_i}{1 - \lambda_{M+1}} x_i\right). \quad (1.244)$$

By the assumption,

$$f\left(\sum_{i=1}^{M} \frac{\lambda_i}{1 - \lambda_{M+1}} x_i\right) \le \sum_{i=1}^{M} \frac{\lambda_i}{1 - \lambda_{M+1}} f(x_i).$$
 (1.245)

Therefore,

$$f\left(\sum_{i=1}^{M+1} \lambda_i x_i\right) \le \lambda_{M+1} f(x_{M+1}) + (1 - \lambda_{M+1}) \sum_{i=1}^{M} \frac{\lambda_i}{1 - \lambda_{M+1}} f(x_i). \quad (1.246)$$

Thus.

$$f\left(\sum_{i=1}^{M+1} \lambda_i x_i\right) \le \sum_{i=1}^{M+1} \lambda_i f(x_i). \tag{1.247}$$

Hence, the assumption is proved by induction on M.

Let x and y be two binary variables where

$$p(x = 0, y = 0) = \frac{1}{3},$$

$$p(x = 0, y = 1) = \frac{1}{3},$$

$$p(x = 1, y = 0) = 0,$$

$$p(x = 1, y = 1) = \frac{1}{3}.$$
(1.248)

(a)

By the definition,

$$H(x) = -\sum p(x) \ln p(x).$$
 (1.249)

By the distribution,

$$p(x = 0) = \frac{2}{3},$$

$$p(x = 1) = \frac{1}{3}.$$
(1.250)

Therefore,

$$H(x) = \ln 3 - \frac{2}{3} \ln 2. \tag{1.251}$$

(b)

By the definition,

$$H(y) = -\sum p(y) \ln p(y).$$
 (1.252)

By the distribution,

$$p(y=0) = \frac{1}{3},$$

$$p(y=1) = \frac{2}{3}.$$
(1.253)

$$H(y) = \ln 3 - \frac{2}{3} \ln 2. \tag{1.254}$$

(c)

By the definition,

$$H(y|x) = -\sum p(x,y) \ln p(y|x).$$
 (1.255)

By the definition,

$$p(y = 0|x = 0) = \frac{p(x = 0, y = 0)}{p(x = 0)},$$

$$p(y = 0|x = 1) = \frac{p(x = 1, y = 0)}{p(x = 1)},$$

$$p(y = 1|x = 0) = \frac{p(x = 0, y = 1)}{p(x = 0)},$$

$$p(y = 1|x = 1) = \frac{p(x = 1, y = 1)}{p(x = 1)}.$$

$$(1.256)$$

Then, by the distribution,

$$p(y = 0|x = 0) = \frac{1}{2},$$

$$p(y = 0|x = 1) = 0,$$

$$p(y = 1|x = 0) = \frac{1}{2},$$

$$p(y = 1|x = 1) = 1.$$
(1.257)

Therefore,

$$H(y|x) = \frac{2}{3}\ln 2. \tag{1.258}$$

(d)

By the definition,

$$H(x|y) = -\sum p(x,y) \ln p(x|y).$$
 (1.259)

By the definition,

$$p(x = 0|y = 0) = \frac{p(x = 0, y = 0)}{p(y = 0)},$$

$$p(x = 0|y = 1) = \frac{p(x = 0, y = 1)}{p(y = 1)},$$

$$p(x = 1|y = 0) = \frac{p(x = 1, y = 0)}{p(y = 0)},$$

$$p(x = 1|y = 1) = \frac{p(x = 1, y = 1)}{p(y = 1)}.$$
(1.260)

Then, by the distribution,

$$p(x = 0|y = 0) = 1,$$

$$p(x = 0|y = 1) = \frac{1}{2},$$

$$p(x = 1|y = 0) = 0,$$

$$p(x = 1|y = 1) = \frac{1}{2}.$$
(1.261)

Therefore,

$$H(x|y) = \frac{2}{3} \ln 2. \tag{1.262}$$

(e)

By the definition,

$$H(x,y) = -\sum p(x,y) \ln p(x,y).$$
 (1.263)

Therefore,

$$H(x,y) = \ln 3.$$
 (1.264)

(f)

By the definition,

$$I(x,y) = -\sum p(x,y) \ln \frac{p(x)p(y)}{p(x,y)}.$$
 (1.265)

By the distribution, the right hand side can be written as

$$H(x) + H(y) - H(x, y).$$
 (1.266)

Therefore,

$$I(x,y) = \ln 3 - \frac{4}{3} \ln 2. \tag{1.267}$$

#### 1.40

Let  $\{x_i\}$  be a set of points where  $x_i > 0$ , and let  $\{\lambda_i\}$  be a set of coefficients where  $\lambda_i \geq 0$  and

$$\sum_{i=1}^{M} \lambda_i = 1. (1.268)$$

By Jensen's inequality,

$$\sum_{i=1}^{M} \lambda_i \ln x_i \le \ln \left( \sum_{i=1}^{M} \lambda_i x_i \right). \tag{1.269}$$

Therefore,

$$\prod_{i=1}^{M} x_i^{\lambda_i} \le \sum_{i=1}^{M} \lambda_i x_i. \tag{1.270}$$

Substituting

$$\lambda_i = \frac{1}{M} \tag{1.271}$$

gives

$$\left(\prod_{i=1}^{M} x_i\right)^{\frac{1}{M}} \le \frac{1}{M} \sum_{i=1}^{M} x_i. \tag{1.272}$$

#### 1.41

Let  $\mathbf{x}$  and  $\mathbf{y}$  be continuous variables. Then, by the definitnion,

$$I(\mathbf{x}, \mathbf{y}) = -\int \int p(\mathbf{x}, \mathbf{y}) \ln \frac{p(\mathbf{x})p(\mathbf{y})}{p(\mathbf{x}, \mathbf{y})} d\mathbf{x} d\mathbf{y}.$$
 (1.273)

The right hand side can be written as

$$-\int \int p(\mathbf{x}, \mathbf{y}) \left( \ln p(\mathbf{x}) + \ln \frac{p(\mathbf{y})}{p(\mathbf{x}, \mathbf{y})} \right) d\mathbf{x} d\mathbf{y}$$

$$= -\int \left( \int p(\mathbf{x}, \mathbf{y}) d\mathbf{y} \right) \ln p(\mathbf{x}) d\mathbf{x} + \int \int p(\mathbf{x}, \mathbf{y}) \ln p(\mathbf{x}|\mathbf{y}) d\mathbf{x} d\mathbf{y}.$$
(1.274)

By the definition, the first term of the right hand side can be written as  $H(\mathbf{x})$  and the second term can be written as  $-H(\mathbf{x}|\mathbf{y})$ . Therefore,

$$I(\mathbf{x}, \mathbf{y}) = H(\mathbf{x}) - H(\mathbf{x}|\mathbf{y}). \tag{1.275}$$

By the definition,

$$I(\mathbf{x}, \mathbf{y}) = I(\mathbf{y}, \mathbf{x}). \tag{1.276}$$

Thus,

$$I(\mathbf{x}, \mathbf{y}) = H(\mathbf{y}) - H(\mathbf{y}|\mathbf{x}). \tag{1.277}$$

# 2 Probability Distributions

### 2.1

Let x be a variable such that

$$p(x|\mu) = \mu^x (1-\mu)^{1-x}, \tag{2.1}$$

where  $x \in \{0, 1\}$ . Then,

$$\sum_{x} p(x|\mu) = 1. \tag{2.2}$$

By the definition,

$$Ex = \mu,$$

$$Ex^2 = \mu,$$
(2.3)

Since

$$var x = Ex^2 - (Ex)^2, \qquad (2.4)$$

we have

$$var x = \mu(1 - \mu). \tag{2.5}$$

By the definition,

$$H(x) = -\sum_{x} p(x|\mu) \ln p(x|\mu).$$
 (2.6)

Therefore,

$$H(x) = -\mu \ln \mu - (1 - \mu) \ln(1 - \mu). \tag{2.7}$$

#### 2.2

Let x be a variable such that

$$p(x|\mu) = \left(\frac{1-\mu}{2}\right)^{\frac{1-x}{2}} \left(\frac{1+\mu}{2}\right)^{\frac{1+x}{2}},\tag{2.8}$$

where  $x \in \{-1, 1\}$ . Then,

$$\sum_{x} p(x|\mu) = 1. \tag{2.9}$$

By the definition,

$$\begin{aligned}
\mathbf{E}x &= \mu, \\
\mathbf{E}x^2 &= 1,
\end{aligned} (2.10)$$

Since

$$var x = Ex^2 - (Ex)^2,$$
 (2.11)

we have

$$var x = 1 - \mu^2. (2.12)$$

By the definition,

$$H(x) = -\sum_{x} p(x|\mu) \ln p(x|\mu).$$
 (2.13)

Therefore,

$$H(x) = -\frac{1-\mu}{2} \ln \frac{1-\mu}{2} - \frac{1+\mu}{2} \ln \frac{1+\mu}{2}.$$
 (2.14)

#### 2.3

By the definition,

$$\binom{N}{m} = \frac{N!}{m!(N-m)!},$$

$$\binom{N}{m-1} = \frac{N!}{(m-1)!(N-m+1)!}$$
(2.15)

Therefore,

$$\binom{N}{m} + \binom{N}{m-1} = \frac{(N-m+1)N! + mN!}{m!(N-m+1)!}.$$
 (2.16)

By the definition, the right hand side can be written as

$$\frac{(N+1)!}{m!(N+1-m)!} = \binom{N+1}{m}.$$
 (2.17)

Thus,

$$\binom{N}{m} + \binom{N}{m-1} = \binom{N+1}{m}. \tag{2.18}$$

Note that

$$1 + x = \sum_{m=0}^{1} {1 \choose m} x^{m}.$$
 (2.19)

Let us assume that

$$(1+x)^N = \sum_{m=0}^N \binom{N}{m} x^m.$$
 (2.20)

Then,

$$(1+x)^{N+1} = \sum_{m=0}^{N} {N \choose m} x^m + \sum_{m=0}^{N} {N \choose m} x^{m+1}.$$
 (2.21)

By the result above, the right hand side can be written as

$$\sum_{m=0}^{N} {N \choose m} x^m + \sum_{m=1}^{N+1} {N \choose m-1} x^m = 1 + x^{N+1} + \sum_{m=1}^{N} {N+1 \choose m} x^m.$$
 (2.22)

Therefore,

$$(1+x)^{N+1} = \sum_{m=0}^{N+1} {N+1 \choose m} x^m.$$
 (2.23)

Thus, the assumption is proved by induction on N.

Finally, let m be a variable such that

$$p(m|\mu) = \binom{N}{m} \mu^m (1-\mu)^{N-m}.$$
 (2.24)

Then

$$\sum_{m=0}^{N} p(m|\mu) = \sum_{m=0}^{N} {N \choose m} \mu^{m} (1-\mu)^{N-m}.$$
 (2.25)

By the result above, the right hand side can be written as

$$(1-\mu)^N \sum_{m=0}^N \binom{N}{m} \left(\frac{\mu}{1-\mu}\right)^m = (1-\mu)^N \left(1 + \frac{\mu}{1-\mu}\right)^N.$$
 (2.26)

Therefore,

$$\sum_{m=0}^{N} p(m|\mu) = 1. (2.27)$$

#### 2.4

Let m be a variable such that

$$p(m|\mu) = \binom{N}{m} \mu^m (1-\mu)^{N-m}.$$
 (2.28)

Then

$$Em = \sum_{m=0}^{N} m \binom{N}{m} \mu^m (1-\mu)^{N-m}.$$
 (2.29)

Differentiating both sides of

$$\sum_{m=0}^{N} \binom{N}{m} \mu^m (1-\mu)^{N-m} = 1 \tag{2.30}$$

with respect to  $\mu$  gives

$$\sum_{m=0}^{N} m \binom{N}{m} \mu^{m-1} (1-\mu)^{N-m} - \sum_{m=0}^{N} (N-m) \binom{N}{m} \mu^{m} (1-\mu)^{N-m-1} = 0. \quad (2.31)$$

The first term of the left hand side can be written as  $\frac{1}{\mu}Em$ . Since

$$(N-m)\binom{N}{m} = N\binom{N-1}{m},\tag{2.32}$$

the second term of the left hand side can be written as

$$-N\sum_{m=0}^{N-1} \binom{N-1}{m} \mu^m (1-\mu)^{N-m-1} = -N.$$
 (2.33)

Therefore,

$$Em = N\mu. (2.34)$$

Differentiating both sides of

$$\sum_{m=0}^{N} \binom{N}{m} \mu^m (1-\mu)^{N-m} = 1$$
 (2.35)

twice with respect to  $\mu$  gives

$$\sum_{m=0}^{N} m(m-1) \binom{N}{m} \mu^{m-2} (1-\mu)^{N-m}$$

$$-2 \sum_{m=0}^{N} m(N-m) \binom{N}{m} \mu^{m-1} (1-\mu)^{N-m-1}$$

$$+ \sum_{m=0}^{N} (N-m)(N-m-1) \binom{N}{m} \mu^{m} (1-\mu)^{N-m-2} = 0.$$
(2.36)

The first term of the left hand side can be written as  $\frac{1}{u^2} Em(m-1)$ . Since

$$m(N-m)\binom{N}{m} = N(N-1)\binom{N-2}{m-1},$$
  

$$(N-m)(N-m-1)\binom{N}{m} = N(N-1)\binom{N-2}{m},$$
(2.37)

the second and third term of the left hand side can be written as

$$-2N(N-1)\sum_{m=1}^{N-1} \binom{N-2}{m-1} \mu^{m-1} (1-\mu)^{N-m-1} = -2N(N-1),$$

$$N(N-1)\sum_{m=0}^{N} \binom{N-2}{m} \mu^{m} (1-\mu)^{N-m-2} = N(N-1).$$
(2.38)

Therefore,

$$Em(m-1) = N(N-1)\mu^{2}.$$
 (2.39)

Thus, since

$$var m = Em(m-1) + Em - (Em)^{2}, (2.40)$$

we have

$$var m = N\mu(1-\mu). \tag{2.41}$$

#### 2.5

By the definition,

$$\Gamma(a)\Gamma(b) = \int_0^\infty x^{a-1} \exp(-x) dx \int_0^\infty y^{b-1} \exp(-y) dy.$$
 (2.42)

By the transformation t = x + y, the right hand side can be written as

$$\int_{0}^{\infty} x^{a-1} \left( \int_{x}^{\infty} (t-x)^{b-1} \exp(-t) dt \right) dx$$

$$= \int_{0}^{\infty} \left( \int_{0}^{t} x^{a-1} (t-x)^{b-1} dx \right) \exp(-t) dt.$$
(2.43)

By the transformation  $x = t\mu$ , the right hand side can be written as

$$\int_{0}^{\infty} \left( \int_{0}^{1} (t\mu)^{a-1} t^{b-1} (1-\mu)^{b-1} t d\mu \right) \exp(-t) dt$$

$$= \int_{0}^{1} \mu^{a-1} (1-\mu)^{b-1} d\mu \int_{0}^{\infty} t^{a+b-1} \exp(-t) dt.$$
(2.44)

By the definition, the second integral of the right hand side can be written as  $\Gamma(a+b)$ . Therefore,

$$\int_0^1 \mu^{a-1} (1-\mu)^{b-1} d\mu = \frac{\Gamma(a)\Gamma(b)}{\Gamma(a+b)}.$$
 (2.45)

#### 2.6

Let  $\mu$  be a variable such that

$$p(\mu|a,b) = \frac{\Gamma(a+b)}{\Gamma(a)\Gamma(b)} \mu^{a-1} (1-\mu)^{b-1}.$$
 (2.46)

Then

$$E\mu = \frac{\Gamma(a+b)}{\Gamma(a)\Gamma(b)} \int_0^1 \mu^a (1-\mu)^{b-1} d\mu, 
E\mu^2 = \frac{\Gamma(a+b)}{\Gamma(a)\Gamma(b)} \int_0^1 \mu^{a+1} (1-\mu)^{b-1} d\mu.$$
(2.47)

Since

$$\int_{0}^{1} \mu^{a} (1-\mu)^{b-1} d\mu = \frac{\Gamma(a+1)\Gamma(b)}{\Gamma(a+b+1)},$$

$$\int_{0}^{1} \mu^{a+1} (1-\mu)^{b-1} d\mu = \frac{\Gamma(a+2)\Gamma(b)}{\Gamma(a+b+2)},$$
(2.48)

we have

$$E\mu = \frac{a}{a+b},$$

$$E\mu^2 = \frac{a(a+1)}{(a+b)(a+b+1)}.$$
(2.49)

Since

$$var\mu = E\mu^2 - (E\mu)^2, \qquad (2.50)$$

we have

$$var\mu = \frac{ab}{(a+b)^2(a+b+1)}.$$
 (2.51)

Since

$$\frac{\partial}{\partial \mu} p(\mu|a,b) = \frac{\Gamma(a+b)}{\Gamma(a)\Gamma(b)} \mu^{a-1} (1-\mu)^{b-1} \left( \frac{a-1}{\mu} - \frac{b-1}{1-\mu} \right), \tag{2.52}$$

we have

$$mode \mu = \frac{a-1}{a+b-2}. (2.53)$$

Let m and l be a variable such that

$$p(m, l|\mu) = {m+l \choose m} \mu^m (1-\mu)^l,$$
 (2.54)

where

$$p(\mu|a,b) = \frac{\Gamma(a+b)}{\Gamma(a)\Gamma(b)} \mu^{a-1} (1-\mu)^{b-1}.$$
 (2.55)

By 2.6,

$$E(\mu|a,b) = \frac{a}{a+b}. (2.56)$$

Note that

$$\mu_{\rm ML} = \frac{m}{m+l}.\tag{2.57}$$

Since

$$p(\mu|m, l, a, b) \propto p(m, l|\mu)p(\mu|a, b), \tag{2.58}$$

we have

$$p(\mu|m,l,a,b) = \frac{\Gamma(m+l+a+b)}{\Gamma(m+a)\Gamma(l+b)} \mu^{m+a-1} (1-\mu)^{l+b-1}.$$
 (2.59)

Therefore, by 2.6,

$$E(\mu|m, l, a, b) = \frac{m+a}{m+l+a+b}.$$
 (2.60)

Thus,

$$E(\mu|m, l, a, b) = \lambda \mu_{ML} + (1 - \lambda)E(\mu|a, b),$$
 (2.61)

where

$$\lambda = \frac{m+l}{m+l+a+b}. (2.62)$$

# 2.8 (Incomplete)

Let x and y be variables. Then, by the definition,

$$Ex = \int xp(x)dx. \tag{2.63}$$

The right hand side can be written as

$$\int x \left( \int p(x,y) dy \right) dx = \int \left( \int x p(x|y) dx \right) p(y) dy. \tag{2.64}$$

Therefore,

$$Ex = E_y (E_x(x|y)). (2.65)$$

By the definition,

$$varx = E(x - Ex)^{2}. (2.66)$$

The right hand side can be written as

$$E_{x,y} (x - E_x(x|y) + E_x(x|y) - E_x)^2 = E_{x,y} (x - E_x(x|y))^2 + 2E_{x,y} ((x - E_x(x|y)) (E_x(x|y) - E_x)) + E_y (E_x(x|y) - E_x)^2$$
(2.67)

Let us look at each term of the right hand side. By the definition, the first term can be written as  $E_y(\operatorname{var}_x(x|y))$ . The second term can be written as

$$2E_y ((E_x(x|y) - Ex) E_x (x - E_x(x|y))) = -2E_y (E_x(x|y) - Ex)^2$$
 (2.68)

By the result above, the third term can be written as

$$E_y (E_x(x|y) - E_y (E_x(x|y)))^2 = var_y (E_x(x|y)).$$
 (2.69)

Therefore,

$$varx = E_y \left( var_x(x|y) \right) + var_y \left( E_x(x|y) \right). \tag{2.70}$$

# 2.9 (Incomplete)

# 2.10 (Incomplete)

Let  $\mu$  be a variable such that

$$p(\boldsymbol{\mu}|\boldsymbol{\alpha}) = \frac{\Gamma\left(\sum_{k=1}^{K} \alpha_k\right)}{\prod_{k=1}^{K} \Gamma(\alpha_k)} \prod_{k=1}^{K} \mu_k^{\alpha_k - 1}.$$
 (2.71)

Then

$$E\mu_j = \int \mu_j p(\boldsymbol{\mu}|\boldsymbol{\alpha}) d\boldsymbol{\mu}. \tag{2.72}$$

The right hand side can be written as

$$\frac{\Gamma\left(\sum_{k=1}^{K} \alpha_k\right)}{\prod_{k=1}^{K} \Gamma(\alpha_k)} \frac{\frac{\Gamma(\alpha_j+1)}{\Gamma(\alpha_j)} \prod_{k=1}^{K} \Gamma(\alpha_k)}{\Gamma\left(\sum_{k=1}^{K} \alpha_k + 1\right)} = \frac{\alpha_j}{\sum_{k=1}^{K} \alpha_k}.$$
(2.73)

$$E\mu_j = \frac{\alpha_j}{\sum_{k=1}^K \alpha_k}.$$
 (2.74)
